

This listing of claims will replace all prior versions, and listings of claims in the application.

**Listing of Claims:**

1. (Currently amended) A communications device for performing conferencing, the device ~~being operable in a first radio communications network and a second different radio communications network and~~ comprising:

a first transceiver for ~~establishing a channel for connection in the first network~~ communicating in a wireless low power radio frequency network; and

a second transceiver for ~~establishing a channel for connection in the second network~~ communicating in a wireless telecommunications network; and

a controller ~~for establishing a call in the first network and configured to control the device to establish a channel for communication with at least one further communications device in the wireless low power radio frequency network, the at least one further communications device being operable to communicate in the wireless low power radio frequency network and also in the wireless telecommunications network, the controller further being configured to control the device to establish a channel for communicating with a destination in the wireless telecommunications network and to provide a communication link for the at least one further communications device to communicate with the destination by routing the a call in the wireless telecommunication network through the channel in the second network~~ the wireless low power radio frequency network to the at least one further communications device.

2. (Previously Presented) A device as claimed in Claim 1, wherein the controller is operable to selectably add members of the first network to the call.

3. (Previously Presented) A device as claimed in Claim 2, including a memory holding data relating to current members of the first network from which the controller selects members to add to the call.

4. (Previously Presented) A device as claimed in Claim 1, wherein the controller is operable to remove a member of the first network from the call.

5. (Previously Presented) A device as claimed in Claim 3, wherein the controller, in accordance with data held in the memory, is inhibited from the selection of a current member of the first network for addition to the call.

6. (Cancelled).

7. (Previously Presented) A device as claimed in Claim 1, wherein the second transceiver is adapted for use in a cellular mobile radio network.

8. (Currently Amended) A method, in a wireless communications device, for ~~of~~ performing conferencing, ~~using a communications device and the method~~ comprising:

establishing a first channel for connection communicating with a destination in a first wireless telecommunications network;

establishing a second channel for connection communicating with at least one further communications device in a second ~~different~~ network, the second network being a wireless low power radio frequency network, the at least one further communications device being operable to communicate in the first and second networks; and

providing a communication link to enable the at least one further communications device to communicate with the destination by routing ~~establishing a call in the first network and routing the call through the~~ second channel in and the second network to the at least one second communications device.

9. (Previously Presented) A method as claimed in Claim 8, including selecting members of the first network to add to the cell.

10. (Previously Presented) A method as claimed in Claim 8, including storing data relating to current members of the first network.

11. (Previously Presented) A method as claimed in Claim 9, including storing data indicative of whether a member of the first network may be selected for addition to the call.

12. (Previously Presented) A method as claimed in Claim 8, including removing a member of the first network from the call.

13. (Currently amended) A first radio communications network including ~~a device as claimed in Claim 1;~~ a communications device for performing conferencing, the device being operable in a first radio communications network and a second different radio communications network and comprising a first transceiver for establishing a channel for connection in the first network and a second transceiver for establishing a channel for connection in the second network and a controller for establishing a call in the first network and routing the call through the channel in the second network.

14. (Currently Amended) A radio communications system comprising:  
a base station of a ~~second radio communications network~~ wireless telecommunications network; and

a plurality of communication devices forming a ~~first wireless communications~~ wireless low power radio frequency network, at least a first one of ~~which the plurality of communications devices being operable in both the wireless low power radio frequency first radio communications network and the second different radio communications~~ wireless telecommunications network ~~and, the at least one first communications device comprising:~~

a first transceiver for ~~establishing a channel for connection~~ communication in the low power radio frequency ~~in the first network; and~~

a second transceiver for communication in the wireless telecommunications network; establishing a channel for connection to the base station in the second network and

a controller ~~for establishing a call in the first network and routing the call through the channel in the second network, the controller being configured to~~

control the at least one first communications device to establish a channel for communication with at least a second one of the plurality of communications device in the low power radio frequency network;

wherein the at least one second communications device is operable to communicate in the low power radio frequency network and also in the wireless telecommunications network, the controller is further configured to control the at least one first device to establish a channel for communicating with a destination in the wireless telecommunications network and to provide a communication link for the at least one second communications device to communicate with the destination by routing a call in the wireless telecommunication network through the wireless low power radio frequency network to the at least one second communications device.

15. (Previously Presented) A system as claimed in Claim 14, wherein the controller is selectably operable and add members of the first network to the call.

16. (Previously Presented) A system as claimed in Claim 14, wherein the device includes a memory holding data relating to current members of the first network.

17. (Previously Presented) A system as claimed in Claim 14, in which the first transceiver is adapted for use in a low power radio frequency.

18. (Previously Presented) A system as claimed in Claim 14, in which the second transceiver is adapted for use in a cellular mobile radio network.

19. (Cancelled).

20. (Previously Presented) A device as claimed in Claim 2, wherein the controller is operable to remove a member of the first network from the call.

21. (Previously Presented) A device as claimed in Claim 3, wherein the controller is operable to remove a member of the first network from the call.

22. (Previously Presented) A device as claimed in Claim 21, wherein the controller, in accordance with data held in the memory, is inhibited from the selection of a current member of the first network for addition to the call.

23. (Cancelled).

24. (Cancelled).

25. (Cancelled).

26. (Cancelled).

27. (Previously Presented) A device as claimed in Claim 2, wherein the second transceiver is adapted for use in a cellular mobile radio network.

28. (Previously Presented) A device as claimed in Claim 3, wherein the second transceiver is adapted for use in a cellular mobile radio network.

29. (Previously Presented) A device as claimed in Claim 4, wherein the second transceiver is adapted for use in a cellular mobile radio network.

30. (Previously Presented) A device as claimed in Claim 5, wherein the second transceiver is adapted for use in a cellular mobile radio network.

31. (Previously Presented) A device as claimed in Claim 6, wherein the second transceiver is adapted for use in a cellular mobile radio network.

32. (Previously Presented) A method as claimed in Claim 9, including storing data relating to current members of the first network.

33. (Previously Presented) A method as claimed in Claim 10, including storing data indicative of whether a member of the first network may be selected for addition to the call.

34. (Previously Presented) A method as claimed in Claim 9, including removing a member of the first network from the call.

35. (Previously Presented) A method as claimed in Claim 10, including removing a member of the first network from the call.

36. (Previously Presented) A method as claimed in Claim 11, including removing a member of the first network from the call.

37. (Currently amended) A ~~first~~ wireless low power radio frequency ~~communications network including a device as claimed in Claim 2~~ a communications device for performing conferencing, the device comprising:

a first transceiver for communicating in the wireless low power radio frequency network;  
a second transceiver for communicating in a wireless telecommunications network; and  
a controller configured to control the device to establish a channel for communication with at least one further communications device in the wireless low power radio frequency network, the at least one further communications device being operable to communicate in the wireless low power radio frequency network and also in the wireless telecommunications network, the controller further being configured to control the device to establish a channel for communicating with a destination in the wireless telecommunications network and to provide a communication link for the at least one further communications device to communicate with the destination by routing a call in the wireless telecommunication network through the wireless low power radio frequency network to the at least one further communications device;

wherein the controller is operable to selectably add members of the first network to the call.

38. (Currently amended) A—The first—wireless low power radio frequency communications—network of claim 37,including a device as claimed in Claim 3 the communications device further including a memory holding data relating to current members of the first network from which the controller selects members to add to the call.

39. (Currently amended) A first—wireless low power radio communications—network including a device as claimed in Claim 4a communications device for performing conferencing, the device comprising:

a first transceiver for communicating in the wireless low power radio frequency network;  
a second transceiver for communicating in a wireless telecommunications network; and  
a controller configured to control the device to establish a channel for communication with at least one further communications device in the wireless low power radio frequency network, the at least one further communications device being operable to communicate in the wireless low power radio frequency network and also in the wireless telecommunications network, the controller further being configured to control the device to establish a channel for communicating with a destination in the wireless telecommunications network and to provide a communication link for the at least one further communications device to communicate with the destination by routing a call in the wireless telecommunication network through the wireless low power radio frequency network to the at least one further communications device;

wherein the controller is operable to selectably add members of the first network to the call;

wherein the controller is operable to remove a member of the first network from the call.

40. (Currently amended) A—The first—wireless low power radio communications frequency network of claim 38, wherein the controller, in accordance with data held in the memory, is inhibited from the selection of a current member of the first network for addition to the call,including a device as claimed in Claim 5.

41. (Cancelled).

42. (Currently amended) A ~~first wireless low power radio communications~~-network including a ~~communications device for performing conferencing, the device comprising:~~  
a first transceiver for communicating in the wireless low power radio frequency network;  
a second transceiver for communicating in a wireless telecommunications network; and  
a controller configured to control the device to establish a channel for communication  
with at least one further communications device in the wireless low power radio frequency  
network, the at least one further communications device being operable to communicate in the  
wireless low power radio frequency network and also in the wireless telecommunications  
network, the controller further being configured to control the device to establish a channel for  
communicating with a destination in the wireless telecommunications network and to provide a  
communication link for the at least one further communications device to communicate with the  
destination by routing a call in the wireless telecommunication network through the wireless low  
power radio frequency network to the at least one further communications device;  
wherein the second transceiver is adapted for use in a cellular mobile radio network;  
device as claimed in Claim 7.

43. (Currently amended) A system as claimed in Claim 15, wherein the at least one  
first communications device includes a memory holding data relating to current members of the  
first network.

44. (Cancelled).

45. (Cancelled).

46. (Previously Presented) A system as claimed in Claim 15, in which the second  
transceiver is adapted for use in a cellular mobile radio network.

47. (Previously Presented) A system as claimed in Claim 16, in which the second transceiver is adapted for use in a cellular mobile radio network.

48. (Previously Presented) A system as claimed in Claim 17, in which the second transceiver is adapted for use in a cellular mobile radio network.

49. (New) A method, in a wireless communication device, for performing conferencing comprising:

establishing a channel for communicating with a further communications device in a wireless low power radio frequency network; and

communicating with a destination in a wireless telecommunications network by routing a call to the further communications device through the low power radio frequency network for forwarding, by the further device, to the destination in the wireless telecommunications network;

wherein the wireless communication device is operable to communicate in the wireless low power radio frequency network and also in the wireless telecommunications network.

50. (New) A communications device for performing conferencing, the device comprising;

a first transceiver for communicating in a wireless low power radio frequency network;

a second transceiver for communicating in a wireless telecommunications network; and

a controller configured to control the device to establish a channel for communication with a further communications device in the wireless low power radio frequency network, and for communicating with a destination in the wireless telecommunications network by routing a call to the second communications device through the wireless low power radio frequency network for forwarding, by the second device, to a destination in the wireless telecommunications network.
